

Create a web site that presents the Analytics feature:

The analytics feature is a filter that defines categories (for example Label) and a sub categories (for example Account A and Account B are sub category of the category Label). You should not implement the actual filter in the task, but only the presentation of it.

Details:

- Each sub category has a checkbox that marks it as selected or not. Notice that more than one sub category can be selected.
- The clear button clears all selected check box. 
- You can select a category using the paint can icon. Notice that only one category can be selected at a time. 
- Each category can be minimized and maximized using the +/- button.

The code should be written in HTML, CSS3 and Angular2/4/5. We expect it to be elegant and generic.

You can ignore the specific fonts, icons, colors.

Good Luck!
